M0533S

100 reactions (50 µl vol) **Lot: 0021204**

RECOMBINANT **Store at –20°C** **Exp: 10/13**

Description: LongAmp® Hot Start *Taq* 2X Master Mix contains a unique blend of aptamer-based Hot Start *Taq* and Deep Vent$_R$® DNA Polymerases. The aptamer-based inhibitor binds reversibly to the enzyme, inhibiting polymerase activity at temperatures below 45°C, but releases the enzyme during normal PCR cycling conditions. This permits assembly of PCR reactions at room temperature. The LongAmp Hot Start *Taq* 2X Master Mix does not require a separate high temperature incubation step to activate the enzyme. The 3´→5´ exonuclease activity of Deep Vent$_R$ DNA Polymerase increases the fidelity and robust amplification of Hot Start *Taq* DNA Polymerase (1). LongAmp Hot Start *Taq* DNA Polymerase offers two-fold higher fidelity than Hot Start *Taq* DNA Polymerase alone. The convenient master mix formulation is supplied at a 2X concentration and contains dNTPs and Mg^{++}, requiring only the addition of primers and DNA template for robust amplification. A wide range of PCR products can be generated; up to 30 kb from lambda or human genomic DNA.

Source: An *E. coli* strain that carries the *Taq* DNA Polymerase gene from *Thermus aquaticus* YT-1 and an *E. coli* strain that carries the Deep Vent$_R$ DNA Polymerase gene from *Pyrococcus* species GB-D.

Applications:

- High-specificity Long Range PCR
- High-throughput PCR

Reaction Conditions: 1X LongAmp Hot Start *Taq* Master Mix, DNA template and primers in a total reaction volume of 50 µl.

1X LongAmp Hot Start *Taq* 2X Master Mix:
60 mM Tris-SO_4 (pH 9.0 @ 25°C)
20 mM $(NH_4)_2SO_4$
2 mM $MgSO_4$
5% glycerol
0.06% IGEPAL®
0.05% Tween-20
0.3 mM dNTPs
125 units/ml LongAmp Hot Start *Taq* DNA Polymerase

Unit Definition: One unit is defined as the amount of enzyme that will incorporate 10 nmol of dNTP into acid insoluble material in 30 minutes at 75°C.

Unit Assay Conditions: 1X ThermoPol Reaction Buffer, 200 µM dNTPs including [^{3}H]-dTTP and 200 µg/ml activated Calf Thymus DNA.

Heat Inactivation: No

Quality Control Assays

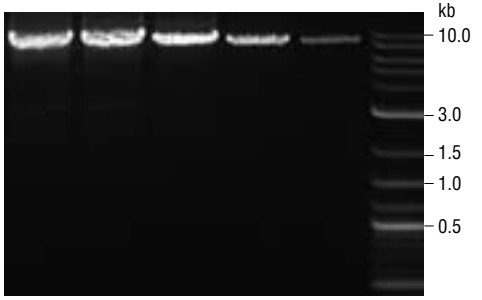
Long Amplicon PCR (Lambda DNA): 28 cycles of PCR amplification in a 25 µl reaction containing 1 ng of Lambda DNA with 1X LongAmp Hot Start *Taq* 2X Master Mix and 0.4 µM primers results in the expected 20 and 30 kb products.

Long Amplicon PCR (Genomic DNA): 28 cycles of PCR amplification in a 25 µl reaction containing 500 ng of human genomic DNA with 1X LongAmp Hot Start *Taq* 2X Master Mix and 0.4 µM primers results in the expected 20 and 30 kb products.

High Sensitivity PCR: 35 cycles of PCR amplification of 2 ng of human genomic DNA with 5 units of LongAmp Hot Start *Taq* DNA Polymerase in the presence of 200 µM dNTPs and 0.2 µM primers in 1X LongAmp *Taq* Reaction Buffer results in the hot start-specific expected 306 bp product after pre-incubation at room temperature for 1 hour.

Inhibition Assay: > 95% inhibition is observed after a 16 hour incubation at 25°C in a 50 µl primer extension assay containing 10 units of LongAmp Hot Start *Taq* DNA Polymerase in 1X ThermoPol Reaction Buffer with 200 µM dNTPs including [^{3}H]-dTTP and 15 nM primed M13 DNA template.

Note: Product specifications for individual components in the LongAmp Hot Start *Taq* 2X Master Mix are available separately.



Amplification of a 8 kb amplicon from varying amounts of Jurkat genomic DNA using LongAmp Hot Start Taq 2X Master Mix. Starting template amounts are indicated below the gel. Marker M is the NEB 2-Log DNA Ladder (NEB #N3200).

PCR

The Polymerase Chain Reaction (PCR) is a powerful and sensitive technique of DNA amplification (2). *Taq* DNA Polymerase is an enzyme widely used in PCR (3). LongAmp Hot Start *Taq* DNA Polymerase allows for greater PCR sensitivity and permits room temperature PCR set-up. The following guidelines are provided to ensure successful PCR using New England Biolabs' LongAmp Hot Start *Taq* 2X Master Mix. These guidelines cover routine PCR reactions. Amplification of templates with high GC content, high secondary structure or low template concentrations may require further optimization.

Reaction Setup:

Due to the hot-start nature of the enzyme, reactions can be assembled on the bench at room temperature and transferred to a thermocycler. No separate activation step is required.

COMPONENT	25 µl REACTION	50 µl REACTION	FINAL CONCENTRATION
LongAmp Hot Start *Taq* 2X Master Mix	12.5 µl	25 µl	1X
10 µM Forward Primer	1 µl	2 µl	0.4 µM (0.05–1 µM)
10 µM Reverse Primer	1 µl	2 µl	0.4 µM (0.05–1 µM)
Template DNA	variable	variable	<1,000 ng
Nuclease-free water	to 25 µl	to 50 µl	

Notes: Gently mix the reaction. Avoid pipetting samples containing target DNA when amplicons above 20 kb are desired. Collect all liquid to the bottom of the tube by a quick spin if necessary. Overlay the sample with mineral oil if using a PCR machine without a heated lid.

Transfer PCR tubes to a PCR machine and begin thermocycling:

Thermocycling Conditions for a Routine PCR:

STEP	TEMP	TIME
Initial Denaturation	94°C	30 seconds
30 Cycles	94°C	10–30 seconds
	45–65°C	15–60 seconds
	65°C	50 seconds/kb
Final Extension	65°C	10 minutes
Hold	4–10°C	

General Guidelines:

1. Template:
   The quality of the DNA template is essential for long-range PCR amplification. Recommended amounts of DNA template for a 50 µl reaction are as follows:

DNA	Up to 15 kb	Above 15 kb
Genomic	1 ng–500 ng	10 ng–1 µg
Plasmid or Viral	1 pg–1 ng	10 pg–10 ng

   Successful amplification above 20 kb largely depends on the quality of DNA templates and the primer sequences.

2. Primers:
   Oligonucleotide primers are generally 20–40 nucleotides in length and ideally have a GC content of 40–60%. Computer programs such as Primer3 (http://frodo.wi.mit.edu/primer3) can be used to design or analyze primers. For amplicons larger than 20 kb, it is desirable to have primers with GC content above 50%, matched T_ms above 60°C and at least 24 nucleotides in length. The final concentration of each primer in a PCR reaction may be 0.05–1 µM, typically 0.1–0.5 µM.

3. Mg^{++}, Deoxynucleotides and Additives:
   At a 1X concentration, LongAmp Hot Start *Taq* Master Mix contains 2 mM $MgSO_4$ and 300 µM of each dNTP in the final reaction. This supports satisfactory amplification of most amplicons. However, Mg^{++} can be further optimized in 0.5 or 1.0 mM increments using $MgSO_4$ (not provided).

   Amplification of some difficult targets, like GC-rich sequences, may be improved with additives, such as DMSO (4) or formamide (5).

(see other side)

CERTIFICATE OF ANALYSIS

4. Denaturation:
LongAmp Hot Start *Taq* DNA Polymerase does not require a separate activation step.

An initial denaturation of 30 seconds at 94°C is sufficient for most amplicons from pure DNA templates. For difficult templates such as GC-rich sequences, a longer denaturation of 2–4 minutes at 94°C is recommended prior to PCR cycling to fully denature the template. With colony PCR, an initial 5 minute denaturation at 94°C is recommended.

During thermocycling, a 10-30 second denaturation at 94 °C is recommended.

5. Annealing:
The annealing step is typically 15–60 seconds. Annealing temperature is based on the T_m of the primer pair and is typically 45–65°C. Annealing temperatures can be optimized by doing a temperature gradient PCR starting 5°C below the calculated T_m.

When primers with annealing temperatures above 60°C are used, a 2-step PCR protocol is possible (see #8).

6. Extension:
The recommended extension temperature is 65°C. Extension times are generally 50 seconds per kb. A final extension of 10 minutes at 65°C is recommended.

7. Cycle Number:
Generally, 25–35 cycles yields sufficient product. Up to 45 cycles may be required to detect low copy number targets.

8. 2-step PCR:
When primers with annealing temperatures above 60°C are used, a 2-step thermocycling protocol is possible.

Thermocycling Conditions for a Routine 2-Step PCR:

STEP	TEMP	TIME
Initial Denaturation	94°C	30 seconds
30 Cycles	94°C	10–30 seconds
	60–65°C	50 seconds/kb
Final Extension	60–65°C	10 minutes
Hold	4–10°C	

9. PCR product:

The majority of the PCR products generated using LongAmp Hot Start *Taq* DNA Polymerase contain dA overhangs at the 3´-end. Therefore, the PCR products can be ligated to the dT/dU-overhang vectors.

FAQs:

1. *What is the fidelity of the LongAmp Hot Start Taq 2X Master Mix compared to Taq DNA Polymerase?*

The LongAmp Hot Start *Taq* 2X Master Mix offers two-fold higher fidelity than *Taq*.

2. *Can the extension step be carried out at 72°C when using LongAmp Hot Start?*

Yes, LongAmp Hot Start *Taq* DNA Polymerase can be used at 72°C. However, extension at 65–68°C is a better choice for most amplicons.

3. *What is the extension rate when using LongAmp Hot Start?*

We recommend 50 seconds per kb for maximum yields. Extension rates such as 30 seconds per kb can be used for targets up to 4 kb using a 3-step PCR protocol. Shorter extension rates, such as 15 seconds per kb, can be used for targets up to 2 kb using a 3-step PCR protocol on a fast PCR machine (e.g. Piko™ PCR machine, Finnzymes, Oy.)

4. *What type of DNA ends result from a primer extension reaction or a PCR using LongAmp Hot Start Taq DNA Polymerase?*

The majority of the PCR products generate using LongAmp Hot Start *Taq* DNA Polymerase contain dA overhangs at the 3´-end. Therefore, the PCR products can be ligated to dT/dU-overhang vectors.

5. *Why is the product a smear when visualized on an agarose gel?*

When PCR conditions are not optimal, a smear or high level of background is often observed. Try one or more of the following suggestions:

- use lower amount of enzymes
- use 65°C for extension
- raise annealing temperature
- try 2-step cycling protocols

6. *Can LongAmp Hot Start Taq 2X Master Mix be used to amplify GC-rich amplicons?*

Yes. The addition of DMSO up to 10% helps amplify GC-rich amplicons.
