Non-Denaturing Unit Definition Assay: Two fold serial dilutions of O-Glycosidase are added to a re-
action mixture of 5 mg of neuraminidase digested
fetuin with 1X G7 Reaction Buffer. The reaction
mix is then incubated at 37°C for 1 hour. O-linked
disaccharide carbohydrates are determined by the
Morgan and Elson Assay (2).

Note: Under denaturing conditions the enzyme
activity is increased two-fold. This observation is
substrate dependent.

Protease Assay: After incubation of 1,400,000 units of O-Glycosidase with 0.2 nmol of a standard mixture of proteins in a 20 µl reaction, for 20 hours at 37°C, no proteolytic activity could be detected by SDS-PAGE.

Protocol: Optimal incubation times and enzyme concentrations must be determined empirically for a particular substrate. Typical reaction conditions are as follows:
1. Combine 10–20 µg of glycoprotein, 1 µl of 10X Glycoprotein Denaturing Buffer and H₂O (if necessary) to make a 10 µl total reaction volume.
2. Denature glycoprotein by heating reaction at 100°C for 10 minutes.
3. Make a total reaction volume of 20 µl by adding 2 µl 10X G7 Reaction Buffer, 2 µl 10% NP40, 2 µl Neuraminidase, H₂O and 1–5 µl O-Glycosidase.
4. Incubate reaction at 37°C for 1–4 hours.

Notes on Use: Since O-Glycosidase is inhibited by SDS, it is essential to have NP-40 in the reaction mixture. It is not known why this non-ionic detergent counteracts the SDS inhibition at the present time. Double digest with Endo H must have NP-40 present (NP-40 does not inhibit Endo H).

To deglycosylate a native glycoprotein, longer incubation time as well as more enzyme may be required.

Recommended storage temperature is –20°C.
