1 µmol **Lot: 0081304**

Store at –20°C **Exp: 4/16**

m^{7}G(5´)ppp(5´)G Sodium Salt

Description: The 5´ terminal m^{7}G cap present on most eukaryotic mRNAs promotes translation *in-vitro* at the initiation level (1,2,3). For most RNAs, elimination of the cap structure causes a loss of stability, especially against exonuclease degradation (4), and a decrease in the formation of the initiation complex of mRNAs for protein synthesis (4,5). Certain prokaryotic mRNAs containing a 5´ terminal cap structure are translated as efficiently as or more efficiently than eukaryotic mRNAs in a eukaryotic cell-free protein synthesizing system (5). Also a cap requirement has been observed for splicing eukaryotic substrate RNAs (6).

A method using *E. coli* RNA polymerase primed with m^{7}G(5´)ppp(5´)G or m^{7}G(5´)ppp(5´)A for an efficient *in vitro* synthesis of capped RNAs has been developed by Contreas (7). Larger amounts of capped RNAs are produced by transcription systems using SP6 RNA polymerase primed with m^{7}G(5´)ppp(5´)G (6).

Quality Controls

The purity and identity of m^{7}G(5´)ppp(5´)G (Cap Analog) is ≥ 95% as determined by HPLC analysis and mass spec respectively.

The RNA Cap Structure Analog is functionally tested for recognition by an RNA Polymerase and its incorporation into a run-off transcript.

Molecular Formula: $C_{21}H_{30}N_{10}O_{18}P_3$ (Free Acid)

Molecular Weight: 803.44 g/mol (Free acid)

Extinction Coefficient: λ_{260} = ~19,000 Lmol-1 cm-1

Note: Addition of 100 µl water gives approximately a 10 mM solution.
