New England Biolabs Product Specification

Assay Name/Specification (minimum release criteria)

Functional Testing (EM-seq™ v2 Library Construction) - Each set of reagents is functionally tested and compared to the previous lot through construction of libraries made from genomic DNA and DNA controls (CpG methylated pUC19 and unmethylated Lambda), that are required for assessment of 5mC and 5hmC. The kit's minimum and maximum DNA input requirements are used to make libraries that are sequenced on the same Illumina® flow cell. Library assessment is based on metrics including library yields, GC bias, insert size and the percent 5mC/5hmC detected for CpG, CHG, CHH contexts within the genomic DNA and internal controls.

* **Individual Product Component Note** - Standard Quality Control Tests are performed for each component included in NEBNext® Enzymatic Methyl-seq v2 Kit and meet the designated specifications.
