## New England Biolabs Product Specification

| Product Name: | Hot Start Taq 2X Master Mix |
| :--- | :--- |
| Catalog \#: | M0496S/L |
| Concentration: | 2 X Concentrate |
| Shelf Life: | 24 months |
| Storage Temp: | $-20^{\circ} \mathrm{C}$ |
| Composition $(1 \mathrm{X}):$ | $10 \mathrm{mM} \mathrm{Tris-HCl}\left(\mathrm{pH} 8.3 @ 25^{\circ} \mathrm{C}\right), 50 \mathrm{mM} \mathrm{KCl}, 1.5 \mathrm{mM} \mathrm{MgCl}, 0.2 \mathrm{mM} \mathrm{dATP}, 0.2 \mathrm{mM} \mathrm{dCTP}, 0.2 \mathrm{mM} \mathrm{dGTP}$, |
|  | $0.2 \mathrm{mMdTTP}, 5 \%$ Glycerol, $25 \mathrm{units} / \mathrm{ml} \mathrm{Hot} \mathrm{Start} \mathrm{Taq} \mathrm{DNA} \mathrm{Polymerase}$ |
| Specification Version: | PS-M0496S/L v1.0 |
| Effective Date: | 11 Jul 2016 |

Assay Name/Specification (minimum release criteria)
Endonuclease Activity (Nicking) - A $50 \mu 1$ reaction in ThermoPol® Reaction Buffer containing $1 \mu \mathrm{~g}$ of supercoiled PhiX174 DNA and a minimum of 20 units of Taq DNA Polymerase incubated for 4 hours at either $37^{\circ} \mathrm{C}$ or $75^{\circ} \mathrm{C}$ results in $<10 \%$ conversion to the nicked form as determined by agarose gel electrophoresis.
Inhibition of Primer Extension (Hot Start, Radioactivity Incorporation) - A $50 \mu 1$ primer extension assay in ThermoPol ${ }^{\Omega}$ Reaction Buffer in the presence of $200 \mu \mathrm{M}$ dNTPs including [ $\left.{ }^{3} \mathrm{H}\right]$-dTTP, containing 15 nM primed single-stranded M13mp18 with 2.5 units of Hot Start Taq DNA Polymerase incubated for 16 hours at $25^{\circ} \mathrm{C}$ yields $>95 \%$ inhibition when compared to a non-hot start control reaction.
Non-Specific DNase Activity ( $\mathbf{1 6}$ hour, Buffer) - A $50 \mu 1$ reaction in 1X Hot Start Taq Master Mix containing $1 \mu \mathrm{~g}$ of T3 DNA in addition to a reaction containing Lambda-HindIII DNA incubated for 16 hours at $37^{\circ} \mathrm{C}$ results in a DNA pattern free of detectable nuclease degradation as determined by agarose gel electrophoresis.
PCR Amplification ( 5 kb Lambda, Master Mix) - A $25 \mu 1$ reaction in 1X Hot Start Taq Master Mix and $0.2 \mu \mathrm{M}$ primers containing 5 ng Lambda DNA for 25 cycles of PCR amplification results in the expected 5 kb product.
PCR Amplification (Hot Start 2 kb Lambda DNA, Master Mix) - A $50 \mu$ reaction in 1X Hot Start Taq Master Mix and $0.2 \mu \mathrm{M}$ primers containing 20 pg Lambda DNA and 100 ng Human Genomic DNA for 30 cycles of PCR amplification results in an increase in yield of the 2 kb Lambda product and a decrease in non-specific genomic bands when compared to a non-hot start control reaction.
Phosphatase Activity (pNPP) - A $200 \mu \mathrm{l}$ reaction in 1 M Diethanolamine, $\mathrm{pH} 9.8,0.5 \mathrm{mM} \mathrm{MgCl}{ }_{2}$ containing 2.5 mM p-Nitrophenyl Phosphate (pNPP) and a minimum of 100 units of Taq DNA Polymerase incubated for 4 hours at $37^{\circ} \mathrm{C}$ yields $<0.0001$ unit of alkaline phosphatase activity as determined by spectrophotometric analysis.

## New England Biolabs Product Specification

Assay Name/Specification (minimum release criteria)
Protein Purity Assay (SDS-PAGE) - Taq DNA Polymerase is $\geq 99 \%$ pure as determined by SDS-PAGE analysis using Coomassie Blue detection.
qPCR DNA Contamination (E. coli Genomic) - A minimum of 5 units of Hot Start Taq DNA Polymerase is screened for the presence of E. coli genomic DNA using SYBR® Green qPCR with primers specific for the E. coli 16 S rRNA locus. Results are quantified using a standard curve generated from purified $E$. coli genomic DNA. The measured level of $E$. coli genomic DNA contamination is $\leq 1 E$. coli genome.
RNase Activity (Extended Digestion) - A $10 \mu 1$ reaction in NEBuffer 4 containing 40 ng of a 300 base single-stranded RNA and a minimum of $1 \mu \mathrm{l}$ of Hot Start Taq 2X Master Mix is incubated at $37^{\circ} \mathrm{C}$. After incubation for 4 hours, $>90 \%$ of the substrate RNA remains intact as determined by gel electrophoresis using fluorescent detection.
Single Stranded DNase Activity (FAM-Labeled Oligo) - A $50 \mu 1$ reaction in ThermoPol® Reaction Buffer containing a 10 nM solution of a fluorescent internal labeled oligonucleotide and a minimum of 25 units of Taq DNA Polymerase incubated for 30 minutes at either $37^{\circ} \mathrm{C}$ or $75^{\circ} \mathrm{C}$ yields $<10 \%$ degradation as determined by capillary electrophoresis.

Date $\quad 11$ Jul 2016
