New England Biolabs Product Specification

Product Name: PacI

Catalog #: R0547S/L/V
Concentration: 10,000 units/ml

Unit Definition:

One unit is defined as the amount of enzyme required to digest 1 µg of pNEB193 DNA in rCutSmart Buffer in 1 hour at

37°C in a total reaction volume of 50 μl.

Shelf Life: 24 months
Storage Temp: -20°C

Storage Conditions: 10 mM Tris-HCl, 200 mM NaCl, 1 mM DTT, 0.1 mM EDTA, 50% Glycerol, 200 µg/ml rAlbumin (pH 7.4 @)

25°C)

Specification Version: PS-R0547S/L/V v2.0

Effective Date: 23 Nov 2021

Assay Name/Specification (minimum release criteria)

Blue-White Screening (Terminal Integrity) - A sample of pNEB193 vector linearized with a 10-fold excess of PacI, religated and transformed into an *E. coli* strain expressing the LacZ beta fragment gene results in <1% white colonies.

Ligation and Recutting (Terminal Integrity) - After a 10-fold over-digestion of pNEB193 DNA with PacI, ~75% of the DNA fragments can be ligated with T4 DNA ligase in 16 hours at 16°C. Of these ligated fragments, >95% can be recut with PacI.

Protein Purity Assay (SDS-PAGE) - PacI is >95% pure as determined by SDS PAGE analysis using Coomassie Blue detection.

Endonuclease Activity (Nicking) - A 50 μ l reaction in rCutSmartTM Buffer containing 1 μ g of supercoiled PhiX174 DNA and a minimum of 30 units of PacI incubated for 4 hours at 37°C results in <10% conversion to the nicked form as determined by agarose gel electrophoresis.

Exonuclease Activity (Radioactivity Release) - A 50 μ l reaction in rCutSmartTM Buffer containing 1 μ g of a mixture of single and double-stranded [3 H] *E. coli* DNA and a minimum of 100 units of PacI incubated for 4 hours at 37°C releases <0.1% of the total radioactivity.

Functional Testing (15 minute Digest) - A 50 μl reaction in rCutSmartTM Buffer containing 1 μg of pNEB193 DNA and 1 μl of PacI incubated for 15 minutes at 37°C results in complete digestion as determined by agarose gel electrophoresis.

Non-Specific DNase Activity (16 Hour) - A 50 μl reaction in rCutSmart™ Buffer containing 1 μg of pNEB193 DNA and a minimum of 100 units of PacI incubated for 16 hours at 37°C results in a DNA pattern free of detectable nuclease degradation as determined by agarose gel electrophoresis.

New England Biolabs Product Specification

Assay Name/Specification (minimum release criteria)

qPCR DNA Contamination (*E. coli* Genomic) - A minimum of 10 units of PacI is screened for the presence of *E. coli* genomic DNA using SYBR® Green qPCR with primers specific for the *E. coli* 16S rRNA locus. Results are quantified using a standard curve generated from purified *E. coli* genomic DNA. The measured level of *E. coli* genomic DNA contamination is ≤ 1 *E. coli* genome.
